

EvalRight – Order Creation Module Documentation

This document explains the Order Creation module inside the EvalRight application. The module allows clients to select verification packages, configure searches, and initiate applicant background verification workflows.

Order Creation Screen

The above screen shows the package selection interface used for creating new background verification orders.

1. Purpose of Order Module

- Allows clients to create new verification orders.
- Provides package-based verification selection.
- Supports applicant onboarding workflow.
- Acts as the starting point of the verification lifecycle.

2. Package Selection Area

- Users can select predefined verification packages.
- Each package contains a set of verification checks.
- Radio buttons allow single package selection.

- Package names identify different verification combinations.

3. Packages Observed

- Basic Screening
- Demo3
- New
- DEMO_3
- Evalright_BGV
- Standard
- DEMO-2
- Nationwide + Federal

4. What's Included Link

- Displays package components.
- Allows clients to understand verification coverage.
- May open popup/modal or detail page.
- Improves package transparency.

5. A La Carte Searches

- Allows manual selection of individual verification checks.
- Supports customized verification workflows.
- Useful when predefined packages are not suitable.
- Provides flexible verification configuration.

6. Navigation Buttons

- Next button moves to applicant information step.
- Start Over button resets selected package.
- Supports step-by-step order creation process.

7. Order Workflow

- Client opens Order module.
- Client selects verification package.
- Optional additional searches are selected.
- Client clicks Next.
- Applicant details form opens.
- Verification order is created.
- Applicant invitation workflow starts.

8. Backend Functional Understanding

- Packages are fetched dynamically from database.
- Each package maps to verification components.
- Selected package creates verification workflow records.
- Order session is maintained between steps.
- Search configurations are stored in order tables.

9. Minor Functional Features

- Radio-button package selection system.
- Responsive grid layout.
- Dynamic package loading.
- Step-based workflow navigation.
- User-friendly onboarding flow.

10. Business Purpose

- Simplifies verification order creation.
- Reduces manual operational effort.
- Ensures standardized verification workflows.
- Improves onboarding efficiency for applicants.

Possible Database Tables Used

Table Name	Purpose
packages	Stores verification packages
package_searches	Stores package verification components
orders	Stores created orders
order_searches	Stores selected searches
applicants	Applicant information
users	Client account management
